

Web Development

Web development, generally refers to the building and developing websites which may be for personal or corporate use. Web development can range from developing the website with simple static interface to the well designed and complex dynamic interface. The era of web development begin with early 1980's with the invention of WWW(World Wide Web). With the evolution of new technology, the advancement of web development has rocketed to the new height with each evolution of the technologies. The web development era is divided into 3 era:

I. Web 1.0

This involves simple interface in which we can only take information from the site. The dynamic behaviour of the site was not possible in this era.

li. Web 2.0

The currently web we have been using can be categorized to this era. We can talk and video chat, live stream in this era.

lii. Web 3.0

The future version of the web development mainly focused in security using blockchain.

It includes the mainly aspects such as web designing and web publishing. Web designing involves the initial phase of the web development. Web development involves development of frontend and backend design. The frontend mainly focus in designing websites using HTML, CSS and javascript. And, backend can be designed using backend languages like php and framework like flask, Django, etc. Framework can help to make website more dynamic and make more enhanced website.
